Vetactin®

Powerful appetite stimulant

Lack of appetite is a common issue in dogs and cats, and its long-term impact can be detrimental to their health. Pet owners may perceive a loss of appetite as suffering or a decrease in quality of life, causing unnecessary stress.

Vetactin® plays a crucial role in the clinical treatment of chronic or acute diseases that may result in reduced appetite.

Indications

Appetite stimulant recommended for cases of hyporexia and anorexia.

Crucial in cases of muscular weakness and physical fatigue.

Promotes weight gain through muscle development.

As a complement to antituberculosis, cancer, antiretroviral and postoperative treatments.

Dosage and administration

Administer orally, directly into the animal's mouth, preferably 2 hours before a meal.

1 mL/2 Kg
every 12 hours

2-4 mL/animal
once to twice daily

Vetactin® is easy to administer:

- Shake the bottle before use.
- Measure the required amount using the syringe and dosing cap.
- Place the syringe at the side of the animal's snout.
- Gently depress the plunger until all the contents are dispensed from the syringe.
- Rinse the syringe between treatment doses.

The use of appetite stimulation therapy should be recommended by a veterinarian as part of the clinical diagnosis process to determine the underlying cause.
